
AIFactoryCAD Enterprise Suite

Engineering Intelligence for the Next Generation of AI Infrastructure

Design. Evaluate. Cost. Deploy.

AI Infrastructure is Becoming Too Complex to Design Manually

The transition from conventional cloud infrastructure to AI Factories has fundamentally changed infrastructure engineering.

Modern AI deployments require architects to simultaneously optimise:

- GPU platforms
- High-performance networking
- Parallel storage
- Rack density
- Power distribution
- Liquid cooling
- Economics
- Operational models
- Deployment risk

Each design decision influences every other.

Traditional architecture documentation, spreadsheets and static reference guides are no longer sufficient.

Introducing AIFactoryCAD Enterprise Suite

AIFactoryCAD Enterprise Suite is the world's first Engineering Intelligence Platform dedicated to AI Factory design.

It transforms customer requirements into deterministic engineering recommendations using compiler technology specifically developed for AI infrastructure.

Rather than relying on disconnected spreadsheets, documents and tribal knowledge, AIFactoryCAD captures engineering expertise as reusable software.

The result is faster design cycles, improved consistency and higher-quality infrastructure recommendations.

Built for Engineering Leaders

AIFactoryCAD has been designed for organisations responsible for designing, operating or commercialising AI infrastructure.

Ideal users include:

Chief Technology Officers

Evaluate strategic infrastructure options before committing capital.

Senior Solutions Architects

Rapidly generate customer-specific AI Factory designs.

NeoCloud Operators

Accelerate GPU infrastructure planning while improving consistency across deployments.

AI Infrastructure Providers

Standardise engineering processes across multiple projects and customers.

Enterprise AI Teams

Develop repeatable reference architectures for internal AI platforms.

From Customer Requirements to Engineering Design

AIFactoryCAD transforms high-level business requirements into structured engineering outputs.

Typical inputs include:

- AI workload
- Model size
- GPU platform
- Deployment model
- Capacity targets
- Power constraints
- Budget objectives

The platform then generates:

- AI Factory reference architectures
 - Infrastructure sizing
 - Engineering assumptions
 - Alternative design options
 - Risk assessments
 - Bills of Materials
 - Deployment plans
 - Executive-ready recommendations
-

Compiler-Driven Engineering

At the heart of AIFactoryCAD is a new software architecture based on Engineering Compilers.

Each compiler captures specialist engineering knowledge within a specific domain.

Examples include:

- Reference Architecture Compiler
- Infrastructure Sizing Compiler
- Storage Compiler
- Network Compiler
- Power Compiler
- Cooling Compiler
- Economics Compiler
- Proposal Compiler

Rather than replacing engineers, these compilers amplify engineering capability by automating repeatable design activities while maintaining deterministic and explainable recommendations.

Engineering You Can Explain

Every recommendation generated by AIFactoryCAD is:

- deterministic
- traceable
- repeatable
- transparent

Recommendations include:

- engineering assumptions
- design constraints
- rule traceability
- confidence
- identified risks

Unlike conventional generative AI, AIFactoryCAD is engineered to explain why a recommendation was made.

Designed for the AI Factory Lifecycle

AIFactoryCAD supports engineering activities across the complete infrastructure lifecycle.

Operations

Expansion

As the platform evolves, additional compiler modules extend capability without changing the underlying engineering model.

Engineering Knowledge as Intellectual Property

The most valuable engineering knowledge within an organisation often exists only inside experienced architects.

AIFactoryCAD transforms that expertise into structured, reusable engineering knowledge.

This enables organisations to:

- standardise engineering quality
- accelerate project delivery
- reduce architectural inconsistency
- preserve institutional knowledge
- onboard engineers faster
- improve proposal quality

Engineering knowledge becomes a strategic organisational asset rather than an individual capability.

Enterprise Ready

The AIFactoryCAD Enterprise Suite has been designed using a modular compiler architecture enabling organisations to extend the platform with additional engineering domains over time.

Future compiler modules include:

- Market Intelligence
- Economics
- Capacity Planning
- Procurement
- Security
- Compliance

- Observability
- Sustainability
- Digital Twin Generation

The platform grows alongside your AI infrastructure business.

Why AIFactoryCAD?

Traditional design approaches rely on:

- spreadsheets
- static reference documents
- disconnected calculations
- manual proposal generation
- individual experience

AIFactoryCAD replaces these fragmented processes with a unified engineering platform capable of producing consistent, explainable and repeatable AI Factory designs.

The Future of AI Infrastructure Engineering

Artificial Intelligence is transforming every industry.

The infrastructure that powers AI deserves engineering tools built specifically for that purpose.

AIFactoryCAD Enterprise Suite represents a new category of engineering software—one that combines deterministic engineering, structured domain knowledge and compiler technology to accelerate the design of next-generation AI infrastructure.

AIFactoryCAD Enterprise Suite

Engineering Intelligence for AI Factories

Design with confidence.

Engineer with consistency.

Deploy at scale.
